**Technical Report**  
**LIST OF COSIMA SUBSTRATE COORDINATES' NAMES**

S. Merouane

Max-Planck-Institute for Solar System Research

---

## **Description**

Rosetta/COSIMA (COmetary Secondary Ion Mass Analyzer) is a mass spectrometer that collects dust particles from the coma of comet 67P/Churyumov-Gerasimenko on metallic targets and analyzes the collected particles by time-of-flight mass spectrometry (TOF-SIMS). The instrument is also equipped with an internal camera, the COSICOPE, which images the collected particles with a resolution of 14  $\mu\text{m}/\text{pixel}$ . Each target holder contains 3 targets, each imaged separately.

The SIMS analyzes are performed on specific coordinates on the collection targets. In order to distinguish different areas on a given target, names are given to specific positions on the target holders. Most of these named coordinates correspond to positions where dust particles have been detected. The particles are detected manually by blinking the image obtained before and after exposure to the cometary dust flux. Some of the names also correspond to centers of areas covered with dust particles, some are given to the coordinates where probable contaminants from the instrument were collected. The X and Y coordinates in the following tables are given in "XM substrate" coordinates. The relations between XM substrate coordinates and COSICOPE image coordinates are given in the section "Coordinate Systems" and sub-section "XM substrate" of the DATASET.CAT file available in the COSIMA archive (<ftp://psa.esac.esa.int/pub/mirror/INTERNATIONAL-ROSETTA-MISSION/COSIMA/>).

## **Naming convention**

Each named coordinates set (X,Y) on a target is given three identifiers:

- an identification number (ID in the following tables): a unique number on each target. These numbers are given in chronological order to the list of coordinates.
- a first name: a unique name on a set of targets.
- a last name: a Finnish Lake name which refers to the period during which a given target holder is exposed to the cometary dust flux. The correspondence between last names and exposure time periods are given below, above the lists of coordinates' names.

Each target named coordinates should be referred as follow:  $XY\text{Y}/\text{Frstname Lastname}$ , with X the number of the target (X = 1 for top target, 2 for the mid-target or 3 for the bottom target) and YY the target holder. For example, 3D0/Kamil Ukonvesi is the position on the bottom target of the holder D0 which first name is Kamil and last name is Ukonvesi.

Note that the coordinates at which new features have been detected when the holder was not exposed as well as the coordinates at which given features have moved after SIMS measurements have a last name in a date format (YYYY\_MM\_DD).

## **Lists of substrate coordinates' names**

The following lists are given chronologically, i.e. from the target set exposed first to the last one exposed. The correspondence between the last names and the exposure periods are given just above

the list of names. In the tables of names, the names are ordered by target (top, mid and bottom), then by last name chronologically and finally alphabetically by firstnames.

## Target holder D0

### Exposure periods
