Issue 1.10.1

12 October 2016

Approved by: Anders Eriksson, RPC-LAP Principal Investigator

Document History

Version	Date	Sections Changed	Notes
1.0	2003-08-19	New document	Initial draft
1.1	2005-08-04	All sections updated.	PDS Software and archive has matured
1.2	2005-11-24	Most sections updated.	Corrections in response to PSA team.
1.3	2006-01-27		Never issued.
1.4	2006-01-31	Minor corrections.	Corrections in response to PSA team.
1.5	2006-10-31	Numerous updates related to PDS review, mostly RID corrections.	PDS archive review.
1.6	2012-07-03	Almost all.	Complete update and revision of all text, taking RIDs from the Lutetia review into account. Geometry info added.
1.7	2012-10-10	Minor corrections.	Corrections in response to comments on previous version. Non-correspondence of file names in EDITED and CALIBRATED described. More details on bias values and their calibration.
1.8	2012-01-30	2.2, 2.3, 2.5, 3.1.4	Editorial and typo correction in response to comments by PSA. All tables renumbered. Improved description of file names in Section 3.1.4.
1.9	2013-08-13		Editorial changes in response to PSA review.
1.9.1	2015-02-23	1.9, 2.5, 4.3.1.5, 4.3.2.2-5	Updated contact names, addresses, a calibration detail (cubic fit), and renamed keywords, other minor edits.

1.9.2	2015-07-07	2.3, Table 2.3-1	Corrected the macro table graphics. Emphasized that the macro table is an example.
1.9.3	2015-09-01	2.4, 2.7, 4.1.4, 4.2.3, 5.3.2.1.5, Tables 3-1, 3-2	New specifications for geometry files.
1.10	2016-08-31	Most sections modified, in particular Sections 2 and 3 (new).	Changes in response to PSA & PDS review. Updates for new CALIBRATED data set format. Updated specification of geometry files, extended descriptions of in-flight data products and HK, added RPCLAP_CALIB_MEAS_EXCEPT.
1.10.1	2016-10-12	Section 3.5, 4.1.4, Table 8	Changes in response to PSA & PDS review. Added missing information on RPCLAP_CALIB_MEAS_EXCEPT. Product ID text as proper table. Mission-specific keywords cleaned up.

1 Introduction

1.1 Purpose and Scope

This document provides users of PSA/PDS data products from the Langmuir Probe instrument of the Rosetta Plasma Consortium (RPC-LAP) with a description of the data products and how they were generated. It is also the official interface between the LAP team and the archiving authority.

1.2 Archiving Authorities

1.2.1 *Planetary Data System (PDS)*

The Planetary Data System Standard is used as archiving standard by

- NASA for U.S. planetary missions, implemented by PDS
- ESA for European planetary missions, implemented by the Research and Scientific Support Department (RSSD) of ESA

1.2.2 *ESA's Planetary Science Archive (PSA)*

ESA implements an online science archive, the PSA,

- to support and ease data ingestion
- to offer additional services to the scientific user community and science operations teams as e.g.
 - search queries that allow searches across instruments, missions and scientific disciplines
 - several data delivery options as
 - direct download of data products, linked files and data sets
 - ftp download of data products, linked files and data sets

The PSA aims for online ingestion of logical archive volumes and will offer the creation of physical archive volumes on request.

1.3 Contents

This document describes the data flow of the LAP instrument on the Rosetta mission from the s/c until the insertion into the PSA for ESA. It includes information on how data were processed, formatted, labeled and uniquely identified. The document discusses general naming schemes for data volumes, data sets, data and label files as well as fundamental features of the instrument. Standards used to generate the product are explained. The design of the data set structure and the data product is given, with some examples.

1.4 Intended Readership

The staff of the archiving authority (Planetary Science Archive, ESA, RSSD, design team) and any potential user of the RPC-LAP data.

1.7 Relationships to Other Interfaces

This document is the top level document for LAP PDS-compliant PSA archiving.

1.8 Acronyms and Abbreviations

ADC	Analog to Digital Converter
ADC16	The 16-bit ADC. One on each probe.
ADC20	The 20-bit ADC. One on each probe.
AQP	Acquisition Period
bps	Bits per second
BM	Burst rate TM mode
DDS	Data Disposition System
DVAL	Data Validation Tool (software)
E	Current bias (E-field measurement) mode of a LAP probe
ESA	European Space Agency
ESOC	European Space Operations Centre
GSE	Ground Support Equipment
HGA	High-Gain Antenna
ICA	Ion Composition Analyzer (other RPC instrument)
HK	Housekeeping
IC	Imperial College, London
IES	Ion and Electron Sensor (other RPC instrument)
IRFU	Swedish Institute of Space Physics, Uppsala (Institutet för rymdfysik, Uppsala)
LAP	Langmuir Probe instrument
LDL	Long Debye Length mode of the MIP instrument
LM	Low rate TM mode
MAG	Fluxgate magnetometer (other RPC instrument)
MIP	Mutual Impedance Probe (other RPC instrument)
N	Voltage bias (density measurement) mode of a LAP probe
NM	Normal rate TM mode

P1	LAP probe 1
P2	LAP probe 2
PDS	Planetary Data System
PIU	Plasma Interface Unit (RPC central unit)
PSA	Planetary Science Archive
PVV	PSA Volume Verifier
RPC	Rosetta Plasma Consortium
s/c	Spacecraft
SDL	Short Debye Length (normal mode of MIP)
SSP	Surface Science Package (the Philae lander)
TM	Telemetry
Vps	Probe-to-spacecraft voltage

2 Overview of Instrument Design, Data Handling and Product Generation

2.1 RPC and LAP

RPC, the Rosetta Plasma Consortium, is a set of instruments on the Rosetta orbiter for investigation of plasma properties and electromagnetic fields. RPC is described in RD3 and RD4. The Langmuir probe instrument is one of these instruments, and is therefore referred to as RPC-LAP or, as we will do in the rest of this document, just LAP.

2.2 The LAP instrument

This section gives a very brief introduction to the LAP instrument, and is recommended reading for any user of any LAP data product. For more complete information, we refer to the two published instrument descriptions, RD1 and RD2.

LAP uses two spherical sensors of 2.5 cm radius, mounted on 15 cm “stubs,” which, in turn, are attached to the ends of the spacecraft booms by a “foot” (see picture on document cover page). Probe 1 is mounted on the “upper” spacecraft boom, also carrying the RPC-MIP antenna (RD5). This boom, which is 2.24 m in length from hinge to probe, is protruding from the spacecraft at an angle of 45° to the nominal comet direction (the z axis in Figure 1; see also Table 1). By pointing to the comet, probe 1 will get access to a plasma flow from the comet as undisturbed as possible by any spacecraft sheath or wakes, without interfering with the field of view of other instruments. Probe 2 is mounted on the “lower” boom, 1.62 m in length, which also carries the RPC-MAG sensors. The distance between the probes is 5.00 m, and the probe separation in the nominal comet direction (z axis) is 4.55 m.

	x (m)	y (m)	z (m)
Probe 1	-1.19	2.43	3.88
Hinge 1	-1.19	0.85	2.30
Probe 2	-2.48	0.78	-0.65
Hinge 2	-1.19	0.65	0.30

Table 1. Positions in the spacecraft coordinate system, indicated in Figure 1, for the LAP probes and for the hinges at the boom roots. [After AD3]

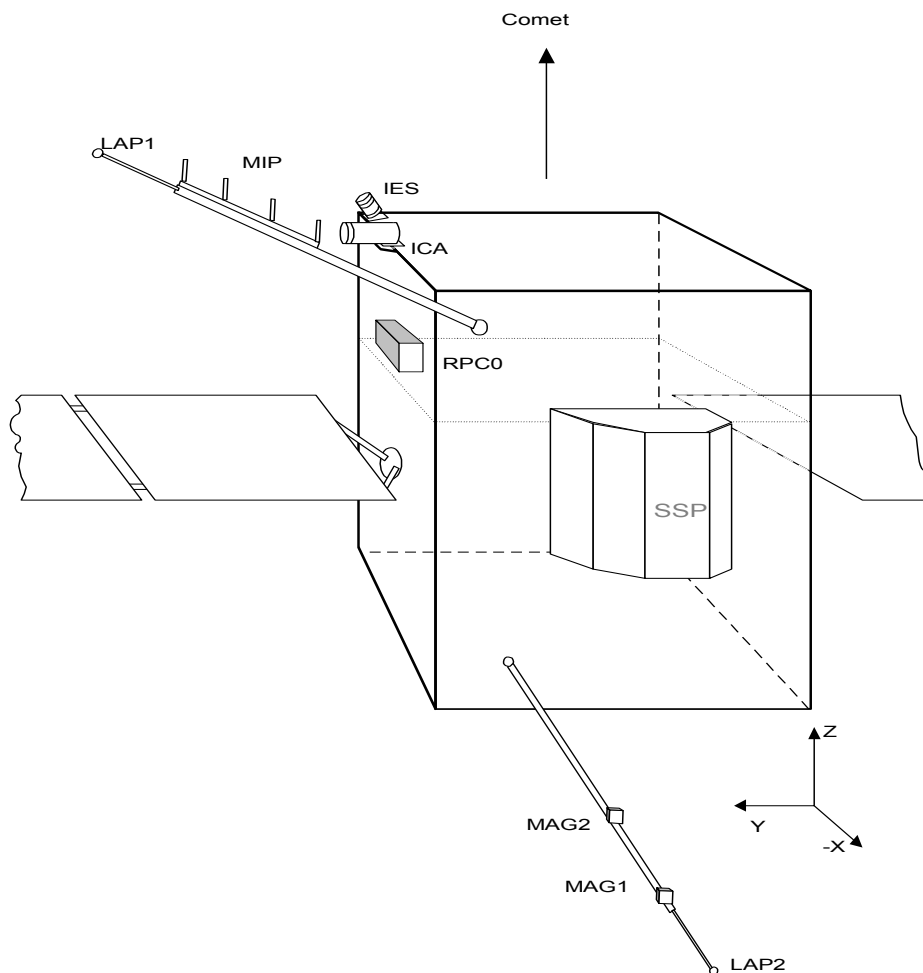

Figure 1. The mounting of the LAP sensors, LAP1 and LAP2, and other RPC units on the Rosetta spacecraft. RPC-0 is the common electronics box, also housing the LAP electronics boards. The direction of the s/c coordinate axes are indicated: the origin of the s/c coordinate system is at the center of the $-Z$ surface (bottom surface in this sketch). SSP is the Philae lander, not part of RPC. [From RD3]

For the two LAP probes, we will here use the designations P1 and P2, though other schemes can be found in the literature and documentation: LAP1 and LAP2 (as in Figure 1), RPC-3.1 and RPC-3.2, probe 1 and probe 1, S1 and S2, and so forth.

The probes can be independently operated in any of two *bias modes*:

- A *bias voltage* can be applied to the probe, in which case the basic measured quantity is the current flowing from the probe to the plasma. In general, we denote this current I_p , with I_1 and I_2 referring to the specific currents from the two probes. This bias

mode is denoted N (for deNsity mode) or (in the EDITED archive data file names) D.

- A *bias current* (including zero, corresponding to floating probes) can be applied to the probe. In this case, the basic quantity measured is the voltage of the probe with respect to the spacecraft, denoted V_{ps} in general, with V1 and V2 denoting the specific signal from each probe. This bias mode is denoted E (for Electric field mode).

Probe P2 may also be used by the RPC-MIP instrument for use in its LDL (Long Debye-Length) mode [RD5]. In this case, LAP can only take data from P1. To indicate how the probes are operated, it is convenient to group the P1 and P2 bias modes together. For example, "NE" then indicates that P1 is in voltage bias mode (N) and P2 in current bias mode (E), while "E-" indicates that P1 is in current bias mode (E) and P2 is not used by LAP because it is being handed over to MIP for LDL operations.

In general, voltage bias is most useful in dense plasmas for determining the prime LAP science parameters of plasma density, electron temperature, plasma flow speed, and the density fluctuation spectrum, while the bias current is applied to get measurements of spacecraft potential and electric (wave) fields. In tenuous plasmas, the density is better obtained from the spacecraft potential. The limit between "dense" and "tenuous" is not absolute but set by the currents flowing to an object at zero potential with respect to the surrounding plasma: "dense" means that the random thermal electron current dominates, "tenuous" that the photoemission current dominates. Hence, the dense-tenuous density limit depends on the photoemission current, which is proportional to the solar UV flux. The limit density therefore follows a $1/r^2$ relation with distance from the sun, and also varies with temporal solar UV intensity variations. In general, the limit varies between at a few hundred cm^{-3} at Earth orbit to a few tens cm^{-3} in the outer part of the Rosetta operational range of solar distances.

The bias applied on a probe can either be set to a constant value or, in the case of bias voltage, "swept", i.e. varied in steps over some range of voltage. LAP also has the possibility to apply a square-wave voltage of up to a few kHz to either probe and observe the resulting signal on the other probe.

Each probe has its own electronics, and can thus be operated independently of the other probe, regarding biasing as well as sampling. To each probe is attached two analog-to-digital converters (ADCs): one 20-bit ADC (ADC20), operating at 57.8 samples/s and denoted L (for low rate sampling), and one 16-bit ADC (ADC16), operating at 18750 samples/s and denoted H (for high rate sampling). Data are low-pass filtered by one of three different filters before sampling, cutting (3 dB damping point) at 20 Hz for L sampling and at 4 kHz or 8 kHz for H sampling. The filter characteristics (available in the files containing the

string FRQ in the CALIB directory, see Section 4.4.3.2) are shown in Figure 2.

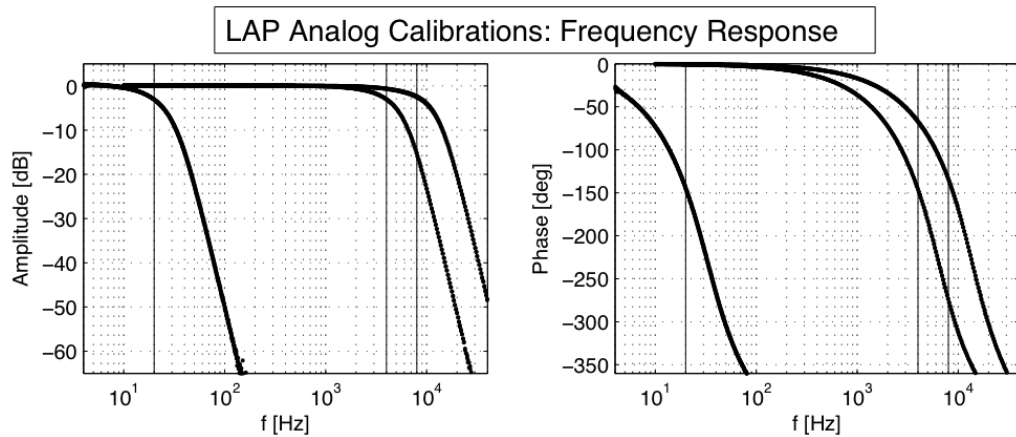

Figure 2. The frequency response of the LAP instrument, showing the rolloff of the three anti-aliasing filters, as obtained during laboratory tests of the flight hardware. Data for P1 and P2 are plotted on top of each other: the probes are identical to the limit of this plot resolution.

A variety of different measurements can be produced by this arrangement, producing different data types. The basic data types are listed below: however, it should be noted that the LAP flight s/w is very flexible, and functions can be defined for construction of other data types not listed here.

- *Fix-bias time series.* With the probes at constant bias (current or voltage), the time series, at some (almost) constant sampling frequency, from both or any of the probes, or derived time series like their sum or their average, can be transmitted.
- *Bias sweeps.* The bias voltage can be varied during a brief interval, known as a sweep. While the samples acquired still constitutes a time series, the basic assumption is that the plasma does not vary during the short sweep, and the sweep is treated as a set of instantaneous and simultaneous samples acquired at different bias. A sweep consists of at least one sequence of monotonously increasing or decreasing bias voltages, possibly followed by another sequence of monotonously decreasing or increasing (i.e. opposite direction) of bias voltages.

Data can be transmitted to the PIU and further to the spacecraft systems at three different data rates or telemetry modes:

- *Low TM mode (LM):* 1.6 bps. Not used for regular science operations.
- *Normal TM mode (NM):* 62.5 bps. Most common mode for science operations.

- *Burst TM mode (BM)*: 2253 bps. Used for shorter intervals when RPC TM allocation so allows.

2.3 LAP Operational Modes - Macros

This section describes the LAP operational mode concept. A general knowledge of these is necessary for at least users of LAP EDITED and CALIBRATED data sets, and could be of interest also to users of future DERIVED data sets.

As described above, and in more detail in RD1 and RD2, the LAP probes can be used in different bias and sampling modes. Such settings are combined in instrument macros, which are command sequences stored in the LAP flash memory (RD1, RD2).

The basic time unit for LAP operations is the spacecraft data acquisition period (AQP) of 32 s. A macro specifies the LAP operations over an integer number of AQPs, with indefinite repetition. When the instrument is commanded to run a certain macro, it thus repeats the sequence of operations specified in the macro until commanded to stop or to change macro. A macro can therefore be said to define an operational mode of LAP.

A macro can contain any LAP command. In practice, macro instructions include the following:

- Bias settings for each probe
- Sweep setup
- Number of samples to acquire from each of the ADCs (beginning at the start of the AQP)
- Onboard data reduction: digital filtering, downsampling, and subtraction or addition of two signals.
- Possible idle wait for a number of AQPs (to keep telemetry within bounds)
- Telemetry mode (LM, NM or BM)

Each macro is identified by a macro ID, which is stored in the data so that the instrument setup is always well known.

The document DOCUMENTS/RO-IRFU-LAPMAC-*yymmdd*.PDF contains a human-friendly summary of the types of measurements made by the various science macros used in the current mission phase. As new macros can be uploaded, the macros actually in use may be different for each phase of the mission. Table 2 shows an example of such a summary.

2.3.1 Example macro explained

To understand the macro table, Table 2, we take as an example macro 0x506, which can be run at Normal telemetry rate. From the table, we can see that when this macro is running, both LAP probes are in bias voltage mode (NN), with a constant bias of +10 V when not sweeping. We can also see that the data sampled by the instrument in this mode are:

- Both probe currents I1 and I2 are available continuously at a time resolution of about 2.2 s (0.45 samples/s). These signals are conveniently denoted as I1L and I2L, the L signifying that the low frequency ADCs (ADC16) are used. Had the probes been in current bias mode, the signals had been voltages denoted V1L and V2L. This continuous sampling is not exactly continuous: the sampling is always reset at the beginning of each AQP, and there may also be one or a few samples missing at the end of an AQP. Despite this, it covers almost all the entire AQP, and is available in every AQP, and hence is at least quasi-continuous. These data are produced by the two 20-bit ADCs at 57.8 samples/s, and are then downsampled by a factor of 128. This downsampling is always by some power of two, so for a macro where the table says continuous data at 0.9 samples/s, the exact number is $57.8/64$ samples/s.
- Every 5th AQP (every 160 s = 5 * 32 s/AQP), 96 samples are taken simultaneously on both probes at full time resolution by the two ADC16 (18.750 kHz). These signals are denoted I1H and I2H, with H signifying high frequency, and referred to as HF snapshots. In macros where the probes are in current bias mode, the HF signals are voltage samples denoted by V1H and V2H. In this particular macro, they cover 5.12 ms (96/18750 s), and can thus be used to study wave activity between 0.2 and 8 kHz (where the low pass filter sets in, see Figure 2). In some macros (e.g. 0x700), digitally computed differences between the probes rather than individual signals are stored.
- Both probes bias voltages are swept between -12 and +12 V every 5th AQP (every 160 s, not the same AQPs as in which the HF snapshots are taken), in steps of 0.5 V. Sweeps are only available in bias voltage mode.

In the LAP EDITED data sets, one file is saved for each record. This means that for this macro, there is for every AQP two data files containing I1L and I2L. For every 5th AQP, there are two additional data files containing I1H and I2H. Also every 5th AQP, there are also two files containing I1S and I2S data. The number of files produced per AQP can thus differ. In CALIBRATED data sets, data are combined to longer time series which are more convenient to work with.

Field colour indicates use:
 Green: preferred non-LDL science macros
 Orange: preferred LDL science macros
 Yellow: maintenance, diagnostics, etc
 Grey: superseded science macros

Text colour indicates telemetry mode:
 Black: Normal Mode
 Blue: Burst Mode

Table 2. Example LAP science macros. LAP science macros uploaded June 2010. Text color indicates normal mode (NM, black) or burst mode (BM, blue) data rate. Background color indicates operational status: Pale green and orange are useful science macros without or with LDL, yellow calibration macros, and grey older science macros. The file DOCUMENTS/RO-IRFU-LAPMAC-yymmdd.PDF contains the table relevant for the current mission phase.

2.4 LAP Archive Data

This section describes the general structure of the LAP archive. It should be of interest to any user of this archive.

In conformance to PDS standards, LAP data are archived at three levels: EDITED, CALIBRATED and DERIVED. For LAP, these correspond to decommutated uncalibrated raw data in TM units (EDITED), data corrected for instrumental offsets and converted to engineering units (V and A; CALIBRATED), and final physical output parameters in physical units (V, cm⁻³, eV etc.; DERIVED), respectively. In more detail:

- EDITED data:
 - Edited science data – the science data stream converted to human and PDS readable format, but still in telemetry units and with no calibrations or corrections applied. One science packet of data from the s/c is converted to one or more files of data in the edited data set, each packet containing the data from one specific measurement. Data files from onboard calibrations are included. The edited science data files are supplied mainly for long term archiving and reference purposes, and are not intended or suitable for regular scientific use.
 - HK data – the HK data stream converted to human and PDS readable format, one file for each LAP HK packet. These data are supplied for long term archiving and reference purposes only, and are not intended or suitable for regular scientific use. The edited HK data files are archived together with the edited science data files.
 - Geometry data – one file per day containing position and attitude information at 32 s intervals throughout the day. The geometry files are archived with the edited science data files.
- CALIBRATED data:
 - Calibrated science data -- the science data stream converted to engineering units (volt and ampere), calibrated and corrected for known offsets and errors. Every type of data is separately collected into a longer time series spanning a macro block (a continuous run of a given macro but still splitting at midnight). Data from pure calibration macros (in particular macro 0x104) are not included since they cannot be used to calibrate themselves. The CALIBRATED data as such are of high quality, but there is no attempt for correction of e.g. attitude-dependent spacecraft-plasma interaction effects (wakes, photoemission, etc.), and scientific interpretation of the data requires great caution.

- Sweep descriptions – Information on step biases and time between steps valid for all sweeps on a given probe within a given macro block.
- Block files – One table per day listing the macro blocks and their respective time coverages.
- Geometry data files – one file per day containing position and attitude information at 32 s intervals throughout the day. The geometry files are archived with the calibrated science data files.
- DERIVED data – science data converted to the basic measurement units of volts and amperes, and further to Vps, plasma density, temperature, flow speed, electric field, or any other parameters that can be derived. One file for each derived parameter results from each uninterrupted period of operation of a certain macro, though files are split as to not cross day boundaries. **No DERIVED data sets are yet available.**

2.5 Calibration process

This section is included for reference and should only be of relevant for users interested in how to derive CALIBRATED data from EDITED data.

The measured EDITED data (current or voltage) are based on the direct output of the analog-to-digital converters (ADCs), and spans the range -32,768 to 32,769=32,767+2 (16-bit ADC), -32,768 to 32,767 (20-bit ADC data truncated to 16 bits) and -524,288 to 524,287 (20-bit ADC data), with 0 representing zero volt measured by the ADC. The 16-bit ADCs have a small fault around zero volt in the analogue-to-digital conversion and therefore we add two TM units to non-negative values to compensate for this. Hence the odd upper limit.

Saturation, i.e. the analogue input to the ADCs being outside of the permitted range, is represented by the minimum digital value, both in the case of positive or negative saturation.

The probe current, be it the bias current in E mode or the measured current in N mode, is by standard convention taken to be positive when flowing from the probe to the plasma. However, to follow the actual settings of the digital-to-analog converters, the bias current values have the opposite sign in the EDITED archive, so that -128 corresponds to a nominal bias current of +44 nA (with conventional sign choice) in the CALIBRATED archive, and +127 to -44 nA. Bias voltages range from -128 to 127 in EDITED, with the same sign as in CALIBRATED. Exact calibration factors are found in the calibration files (see below).

The data in the CALIBRATED data sets have been calibrated using the contents of the CALIB directory (see Section 4.4.3.2). Here yymmdd notes the time from which the file is applicable.

- **Measured voltages (E-field mode)** are converted to volts from TM units by application of the calibration factors ROSETTA:LAP_VOLTAGE_CAL_16B and ROSETTA:LAP_VOLTAGE_CAL_20B (for data from the 16- and 20-bit ADCs, respectively) based on pre-flight ground tests. These are available in the RPCLAPyymmdd_CALIB_MEAS.LBL files. 20-bit ADC data which are truncated to 16 bits (this is indicated in the label file; see keyword ROSETTA:LAP_P1P2_ADC20_STATUS, Section 5.3.1.5) are additionally divided by another factor 16 to compensate for this (which means that the effective calibration factors for truncated 20-bit ADC data become very similar to the calibration factors for the 16-bit ADCs).
 - **Measured currents (bias mode N)** are converted to amperes from TM units in a two-stage process:
 - These measurements are sensitive to inevitable bias-dependent offsets due to small leakage currents in the instrument. The offsets are determined regularly by running macro 0x104 (Table 2), in which the probes are physically disconnected from the electronics by opening a relay. The then measured bias-dependent voltages originate from the instrument electronics themselves. The offsets (in TM units) are fitted to a third-degree polynomial function, are stored in the RPCLAPyymmdd_CALIB_MEAS.TAB files and are subtracted from the data. A cubic fit is used rather than tabulated values, to reduce the possible influence of noise during offset determination. The following algorithm is used to determine which RPCLAPyymmdd_CALIB_MEAS product to use for a given data sample: Take the beginning of the AQP to which the sample belongs. Then determine when is the middle of that day (noon, 12:00). Finally, determine which calibration took place closest to that point in time, and use that. This ensures that a change of calibration always occurs at approximately midnight and never within an AQP (e.g. within a sweep), and never in the middle of a CALIBRATED data product.
 - After offset removal, we apply the relevant calibration factor of ROSETTA:LAP_CURRENT_CAL_16B_G1, ROSETTA:LAP_CURRENT_CAL_20B_G1, ROSETTA:LAP_CURRENT_CAL_16B_G0_05, or ROSETTA:LAP_CURRENT_CAL_20B_G0_05, all measured on ground and stored in the RPCLAPyymmdd_CALIB_MEAS.LBL files. The ADC (16 or 20 bit) and gain (1 or 0.05) determines which factor is used. The comment on calibration factor change due to truncation

of data stated above for voltage data (bias mode E) applies here as well. Analogous to measured voltages, measured 20-bit ADC current data which are truncated to 16 bits are additionally divided by another factor 16 to compensate.

- **Bias voltages and bias currents** are not routinely measured onboard. Their digital values are synthetically generated from knowledge of the commanded bias, after which they are converted to physical units (volts and amperes) using the calibration tables contained in the files RPCLAP030101_CALIB_VBIAS.TAB and RPCLAP030101_CALIB_IBIAS.TAB, determined on ground. While there is no routine measurement of the biases onboard, it is possible to measure the current resulting from a given voltage bias applied over a 5.1 Mohm resistor (e.g. via macro 0x105) for occasional verification of the instrument integrity and consistency.

The CALIB directory also includes files with the instrument frequency response measured on ground (transfer functions; See Section 4.4.3.2). These are not used at present, but are included for reference as vital instrument information.

2.6 Data Quality Flag

The EDITED and CALIBRATED data sets just present the output of the instrument, and are as such of high quality. There is therefore no attempt to assign a detailed quality assessment of these data. The LBL files contain a placeholder quality indicator DATA_QUALITY_ID always set to 1. Further use of this flag is expected only for the DERIVED data set.

3 Overview of Data Products

This section describes the organization of the LAP data products. The descriptions of science data products (Section 3.1), caveats (Section 3.2), documentation (Section 3.7) should be of interest to any user of the archived LAP data. **The regular user should only be interested in the CALIBRATED-level data sets**, and eventually in the DERIVED-level data sets.

Note that there is as of yet no DERIVED-level data set.

3.1 Science Data Products

For EDITED and CALIBRATED data the LAP data sets contain the data products in Table 3 and Table 4, all of them stored in table (.TAB) files and described in label (.LBL) files. Note that probe, data type etc is specified in data file names and product IDs and that they are explained further in Section 4.1.4.

EDITED Science Data Products			
Data type	Columns		Product ID
	Number of columns	Column data	
(1) Time series (fix bias; LF/HF), or (2) sweep	1	UTC time	RPCLAPYYMMDD_AAAa_bcd1fgS (probe 1)
	1	OBT time	
	1	Current; bias or measured	RPCLAPYYMMDD_AAAa_bcd2fgS (probe 2)
	1	Voltage; bias or measured	
Difference measurements, E-field	1	UTC time	RPCLAPYYMMDD_AAAa_bEd3fgS
	1	OBT time	
	2	Current bias, P1 and P2	
	1	Measured voltage difference, P1 minus P2	
Difference measurements, Density mode	1	UTC time	RPCLAPYYMMDD_AAAa_bDd3fgS
	1	OBT time	
	1	Measured current difference, P1 minus P2	
	2	Voltage bias, P1 and P2	

Table 3. LAP data products in the EDITED data sets. The complete product ID convention can be found in Section 4.1.4.

CALIBRATED Science Data Products			
Data type	Columns		Product ID
	Number of columns	Column data	
Time series (fix bias; LF/HF)	1	UTC time	LAP_YYMMDD_hhmmss_iii_jek ("e" = probe = 1 or 2)
	1	OBT time	
	1	Current; bias or measured	
	1	Voltage; bias or measured	
	1	Quality	
Difference measurements, E-field	1	UTC time	LAP_YYMMDD_hhmmss_iii_V3L
	1	OBT time	
	2	Current bias, P1 and P2	
	1	Measured voltage difference, P1 minus P2	
	1	Quality	
Difference measurements, Density mode	1	UTC time	LAP_YYMMDD_hhmmss_iii_I3L
	1	OBT time	
	1	Measured current difference, P1 minus P2	
	2	Voltage bias, P1 and P2	
	1	Quality	
Sweep data	1	Start UTC time	LAP_YYMMDD_hhmmss_iii_leS ("e" = probe = 1 or 2)
	1	Stop UTC time	
	1	Start OBT time	
	1	Stop OBT time	
	1	Quality	
	N (varies)	Measured currents for every step of a sweep	

Sweep descriptions (step biases and time between steps)	1	Step time (seconds since beginning of sweep)	LAP_YYMMDD_hhmmss_iii_BeS (<i>"e"</i> = probe = 1 or 2)
	1	Step bias	
Block list	1	UTC start time	LAP_YYMMDD_000000_BLK LIST. <i>ext</i>
	1	UTC stop time	
	1	Macro ID	

Table 4. LAP data products in CALIBRATED data sets. The complete product ID convention can be found in Section 4.1.4.

Sweep descriptions (calibrated) are needed to understand the biases and times of measurement for sweeps. They are given once per probe and macro block since they are identical for all sweeps for a given macro. Block lists contain the macros that have been run during a given day and when. Calibrated science data products (not block lists) cover an entire macro block.

To understand and classify the types of LAP science data available one must consider that every LAP science data product is based on data acquired using a certain combination of instrument options (settings). For a single data product, many of these options can be set independently of each other, but not necessarily in all combinations, and not all combinations are useful.

The list below summarizes the most important options which can be combined to produce different types of science data products. Each item lists mutually exclusive options, where exactly one option under every item is always used for a single data product. "Data" here refers to any one edited or calibrated science data product. Multiple such data products can cover the same time interval.

- Data is always acquired from either
 - P1,
 - P2, or
 - "P3" = The (onboard) calculated value of P1 minus P2.
- Data is always acquired in either
 - density mode (bias voltage; measures current), or
 - E field mode (bias current; measures voltage)
- Data is always acquired in either of two bias modes:
 - sweep bias (with measurements via ADC16), i.e. bias rapidly sweeping over voltages (not currents) within a short period of time

- fix bias, which is always acquired in any of the two forms below:
 - LF, i.e. low frequency samplings (and using ADC20 for measurements) which for the most of the time are quasi-continuous, or
 - HF, i.e. short high-frequency snapshots (and using ADC16 for measurements)

For technical reasons, it may however also be important to know that

- Data is always acquired through either of the two different ADCs connected to each probe listed below:
 - ADC20, with a physical low-pass filter with a cutoff at 20 Hz
 - ADC16, with a physical low-pass filter with a cutoff at either of the two options below:
 - 4 kHz, or
 - 8 kHz

All of these settings can be determined from the flags in the data product ID as well as the file name (except the ADC16 4 kHz/8 kHz filter setting in CALIBRATED), see Section 4.1.4. (Note: LF/HF can be determined indirectly from the EDITED filenames via ADC+fix bias.) The remaining, and more technical and obscure settings, can be determined from mission-specific PDS keywords found in the data product label files, see Section 5.3.1.5.

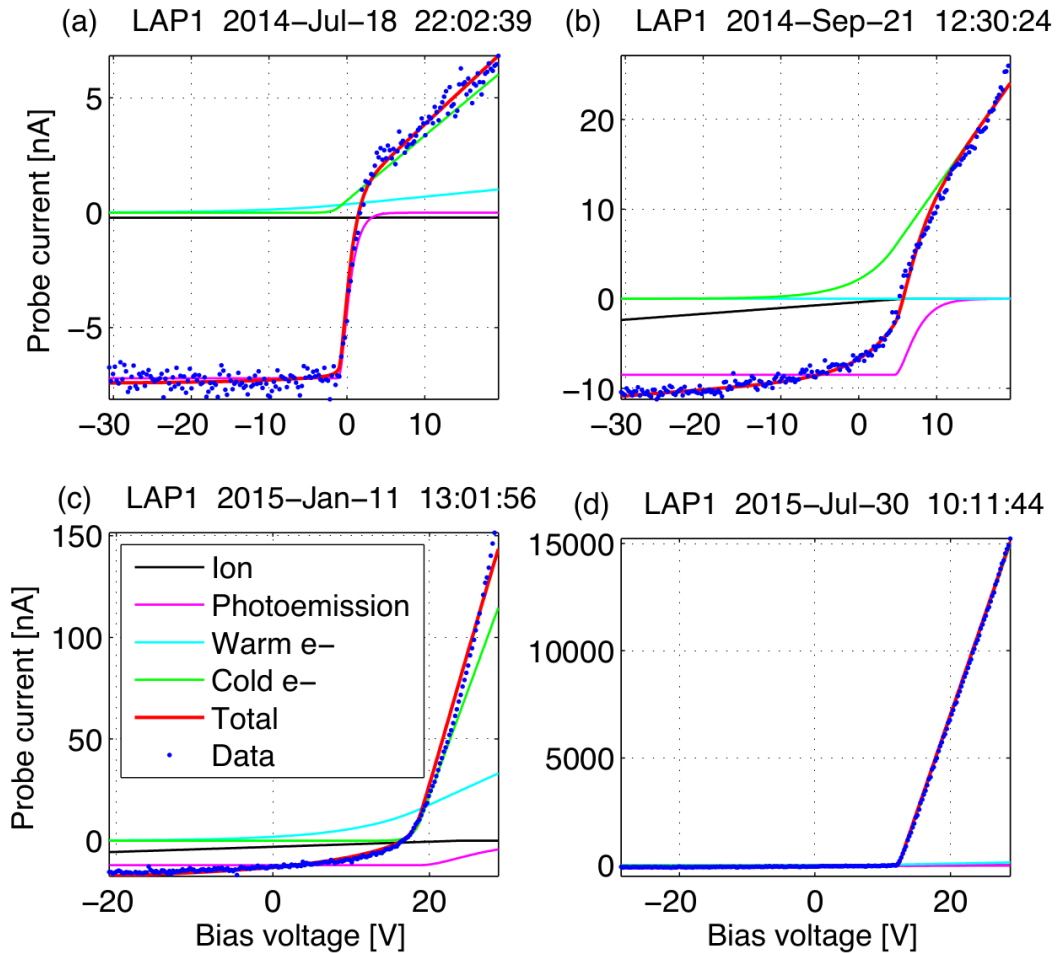

Figure 3. Examples of LAP probe sweep characteristics from various mission phases, fitted to orbital-motion-limited (OML) current models. Distances in AU are heliocentric, in km are cometocentric. Data are blue dots, fitted currents given by colors as in the box in panel (c). Panels: (a) Solar wind prior to arrival at comet (3.7 AU, 7,000 km). (b) Warm electrons at early activity (3.33 AU, 35 km). (c) Cold electrons mix in as activity increases (2.57 AU, 28 km). (d) Dense cold plasma near perihelion (1.25 AU, 180 km).

The exact science data products which are actually available within a certain (not too short) time interval depends on the LAP macro (see Section 2.3) which actually ran at the time. The macro which produced a particular data product can be derived from the value of the PDS keyword INSTRUMENT_MODE_ID in the data product label files, see Section 5.3.1.5. This however only necessary for EDITED, since CALIBRATED data products contain the macro ID in the filename. The file DOCUMENTS/RO-IRFU-LAPMAC-*yymmdd*.PDF contains a human reader-friendly table over what the science macros relevant for the current mission phase do.

For most macros, and the great majority of time, the main data products will be found in the time series or sweep data products in Table 3. In the EDITED archives, each file includes data covering up to 32 seconds of time (one AQP). Therefore, a large number of files may need to be opened for studies of longer time intervals of EDITED data.

Important caveats relating science data can be found in Section 3.2.

3.1.1 Data Quality Flag

The CALIBRATED data set has a quality factor ranging from 000 (best quality) to 999 (worst), based on assessment of the rotation of the spacecraft during measurement, possible perturbation effects from other instruments (LDL), low sample size, etc. Each detrimental quality effect is an integer additive component to the total quality factor of each data point. The quality factor flag is constructed so that each value can only be reached by a unique combination of factors detrimental to the quality of the data. The full list can be seen below:

Quality factor event description	Additive effect
Known bug (not used) during measurement	+200
Langmuir probe sweep during measurement	+100
LDL disturbance (MIP in LDL mode)	+40
Bias change near measurement	+20
SAA rotation of more than 0.01° during sweep	+10
Low sample size / zero padding	+2
Poor model fit in analysis (DERIVED)	+1

3.2 Caveats When Interpreting Science Data

This section lists technical details which are important for regular LAP data users to be aware of:

3.2.1 General

- After hibernation, LAP probe 2 (P2) showed strong signs of contamination. Clear signs of this include that the current to P2 is always lower than to P1 at similar bias voltage, and sweeps in both directions (available from macro 0x204) showing hysteresis effects.

To avoid problems, **only use probe 2 current measurements obtained at fixed negative bias potential**, as available in e.g. macros 0x525, 0x624, and 0x805. **The PI discourages any other use of P2 data in this archive except for diagnostics.**

- Saturated data means that the pre-ADC signal is outside the range of the ADC. It can thus not be properly represented digitally and should not be used. **Saturation on either the positive or negative side is represented as the maximum *negative* value** in the data (i.e. -32,768 in EDITED 16-bit or truncated 20-bit data; -524,288 for non-truncated 20-bit data; or e.g. -40 V in CALIBRATED E mode data). See Section 2.5.
- **Fix bias values included in the files are not measured but reconstructed from the instrument command log**, calibrations, and the known characteristics of the instrument modes (macros). When the fix bias value on any of the probes is changed by telecommand, the bias step will be seen in the data files at the time of telecommand execution. **The bias setting actually takes effect 2-3 seconds later**, as can be seen in data. In addition, in certain plasmas the time constant for charging a probe when in current bias mode (E mode) can be so long that there is a further delay before the bias has settled. Users should thus take care when interpreting data close to a bias setting. This only applies to measurements at fixed bias; the bias voltage in sweeps has correct timing. See also Section 2.5.
- **There is obvious interference from the MIP instrument when using its LDL mode** (e.g. when running macros 0x801 or 0x807). This affects mainly the data sampled at kHz frequencies at fixed bias and in sweeps. For the fix bias snapshots at 18.75 kHz sampling frequency, this mostly affects the first samples in a record, but can in longer records sometimes be seen also further into the record. In sweeps from e.g. macro 0x807, MIP interference can be detected as spikes where one or two samples deviate from their neighbors. Some MIP interference may occur also outside of LDL operations, as might of course interference from other sources. LDL mode (on/off) is determined by the macro running and is therefore the same during every run of any particular macro. Therefore the LDL mode can be detected through the macro number and the macro table in the DOCUMENT directory. The column MIPLAP (not LDLMODE) in HK (Table 6) can also be used to detect the LDL mode. Each step in a calibrated sweep only contains one average of multiple measured currents made on that sweep step (bias voltage). Outliers will be removed before the average is made, and only if all measurements on a sweep step are outliers will the average for that step be removed.
- **The transfer functions are currently not used for calibration**, but are provided for reference.

3.2.2 Fix-bias measurements

- For probe-to-spacecraft potential (Vps) time series: this is a commonly used proxy for the plasma density in tenuous plasmas. However, because the perturbations from the solar panels, the wake formed behind the s/c and solar panels in the solar wind, and the photoelectron cloud around the spacecraft are all sensitive to the probe location, **Vps can be used as a density proxy only during intervals of constant pointing**. See the paper by Edberg et al (RD6) for an example of how Vps may be used as a plasma density proxy. Perturbations from wake and photoemission have been studied by Sjogren (report available at http://www.space.irfu.se/exjobb/2009_alex_sjogren/).

3.2.3 Sweep measurements

- **Probe bias sweeps are sensitive to the spacecraft pointing** for the same reasons that fix-bias time measurements are. However, for all sweeps obtained prior to the comet phase, except some acquired in Earth's plasmasphere, the ion contribution to the data is so low that the photoemission saturation current can be obtained at all angles for which the probe is sunlit. Note however that the probe may be partially shadowed by its supporting rod (the stub), and that surface inhomogeneities may cause the photoemission to vary also with the pointing.
- For all sweeps obtained before coming close to the nucleus in September 2014, and for some parts also later on, the dominating contributions to the probe current are probe photoemission (at negative bias voltage) and collection of photoelectrons emitted by the spacecraft and solar panels (at positive bias voltage). Hence, probe sweep data can be interpreted in terms of local plasma parameters only in the Earth's plasmasphere. The main reasons for occasionally running such sweeps in other environments, e.g. the solar wind and the Earth's magnetosphere, are to gather data for investigation of spacecraft-plasma-probe interactions and to monitor probe photoemission.

3.3 Geometry Data Products

The geometry data are all produced by using the SPICE toolkit with kernels for Rosetta provided and updated by ESA. These data include the most important parameters for understanding the LAP measurements and are provided once every 32 seconds (once per AQP). The position is provided in target-centered solar orbital coordinates (TSO), which for the specific cases of 67P, Mars and Earth are known as cometocentric solar orbital (CSO), Mars centric orbital

(MSO) and geocentric solar ecliptic (GSE) coordinates, respectively. In these coordinates:

- X points towards the sun.
- Z is along the normal (the angular momentum vector) of the target (67P, Mars, Earth) orbit around the sun.
- Y completes the right hand triad (X,Y,Z).

The latitude and longitude are given in target-centered geographic coordinates, rotating with the target. For Rosetta at 67P, this is the Cheops system.

The solar zenith angle (SZA), commonly also known as the s/c phase angle, is the angle sun-target-Rosetta (0 deg. at the subsolar point, 90 deg. at the terminator).

The solar aspect and elevation angles are provided for describing the positions of the LAP probes w.r.t. the solar direction, and thereby regulates their illumination which is important to know since this controls the probes' emission of photoelectrons. To intuitively and visually understand these angles, consider the spacecraft coordinate system in Figure 1. The solar panels are nominally held perpendicular to the direction of the sun, meaning it stays in the s/c XZ plane. The illumination of the probes thus depends on one angle alone, which we can take to be the angle from the s/c Z axis to the solar direction, counted as increasing from zero when the sun moves from +Z towards +X in the s/c frame. This we define to be the solar aspect angle, SAA. It is complemented by the solar elevation angle, SEA, which nominally is zero but attains positive (negative) values if the sun moves out of the s/c XZ plane toward the s/c +Y (-Y) axis. For the nominal case of SEA = 0, the probe illumination is given by SAA as:

-179 deg. < SAA < 18 deg.	Both probes sunlit
18 deg. < SAA < 82 deg.	P1 sunlit; P2 in shadow behind s/c body
82 deg. < SAA < 107 deg.	P1 sunlit; P2 possibly in shadow behind the high-gain antenna (HGA) depending on how the HGA is turned.
107 deg. < SAA < 131 deg.	Both probes sunlit
131 deg. < SAA < 181 deg.	P1 in shadow behind solar array; P2 sunlit

The target aspect and elevation angles (TAA and TEA) are similar except for referring to the target body instead of the sun. They are useful mainly at the comet in the case of TEA = 0 (i.e. the nucleus in the s/c XZ plane), as similar TAA intervals as for SAA above will indicate if the probes are exposed to or in the wake of a nominal radial outward plasma flow from the nucleus (corresponding to the sunlit and shadowed cases for SAA). This information is very much more approximate than the

rather exact solar illumination and should be used only as a rough indication, because of the often non-radial plasma flow as well as by the fact that there is no guarantee the solar array normal will be along the flow direction -- in fact, it is mostly perpendicular to that direction.

Column	Name	Description
1	TIME.UTC	UTC time
2	OBT.TIME	OBT time
3	X.TSO	Target-centric solar orbital coordinates [km]
4	Y.TSO	
5	Z.TSO	
6	LATITUDE	Spacecraft latitude in target coordinates [deg.]
7	LONGITUDE	Spacecraft longitude in target coordinates [deg.]
8	SZA	Solar zenith angle (SZA), a.k.a. phase angle [deg.]
9	SAA	Solar aspect angle (SAA) [deg.]
10	TAA	Target aspect angle (TAA) [deg.]
11	SEA	Solar elevation angle (SEA) [deg.]
12	TEA	Target elevation angle (TEA) [deg.]

Table 5. LAP geometry file content.

3.4 Housekeeping Data Products

The HK parameters, only present in the EDITED archive, should not be of interest to normal science users since they do not provide any information not already present in the description of the macro. They are listed and described above for completeness. They are used for monitoring instrument operation and have no scientific interest on their own.

Column	Name	Description and values
1	UTC.TIME	Generation time of HK packet (UT).
2	OBT.TIME	Generation time of HK packet (s/c clock counter)
3	PMAC	Currently programming macro (nonzero only during upload of instrument macros)
4	EMAC	Currently executing macro (indicates number within bank of last started macro)
5	WATCHD	Watchdog status (usually ENABLED, DISABLED only when uploading new macros)
6	PROMEN	PROM and flash memory status (usually DISABLED, ENABLED only at boot time and when uploading new macros)
7	OSC	Using oscillator (using oscillator 0 or 1)
8	LDL.MODE	LDL mode and phase (this refers to an old LDL implementation not used in main mission, therefore always NONE)

Column	Name	Description and values
9	TEMP	Temperature sensor status (usually DISABLED, ENABLED only when booting up)
10	CDRIV2	Range P2 bias (+-32 or +-1.3 V; usually +-32)
11	CDRIV1	Range P1 bias (+-32 or +-1.3 V; usually +-32)
12	E2D216	ADC 16 P2 mode (E-FIELD or DENSITY)
13	E1D116	ADC 16 P1 mode (E-FIELD or DENSITY)
14	E2D120	ADC 20 P2 mode (E-FIELD or DENSITY)
15	E1D120	ADC 20 P1 mode (E-FIELD or DENSITY)
16	CNTRE2	P2 feedback (E-FIELD or DENSITY)
17	CNTRE1	P1 feedback (E-FIELD or DENSITY)
18	MIPLAP	Instrument using probe 2 (LAP or MIP)
19	BTSTRP	Internal bootstrap status (usually ENABLED, rarely DISABLED)
20	F2122	P2 connected to: RX=analog input (usual), TX=transmitter (very rare)
21	F22ED	P2 bias mode (DENSITY or E-FIELD)
22	F22EDEDC	P2 density range or E-field strategy (for DENSITY, G1.0 or G.05 gives high or the rarely used low gain; for E-FIELD, BIAS or FLOAT specifies if a bias current is applied or the probe is floating)
23	F1121	P1 connected to: RX=analog input (usual), TX=transmitter (very rare)
24	F11ED	P1 bias mode (DENSITY or E-FIELD)
25	F11EDEDC	P1 density range or E-field strategy (for DENSITY, G1.0 or G.05 gives high or the rarely used low gain; for E-FIELD, BIAS or FLOAT specifies if a bias current is applied or the probe is floating)
26	CALIBRATIONA	Flash checksum at reboot, then most significant byte of macro identifier.
27	CALIBRATIONB	Flash checksum at reboot, then least significant byte of macro identifier.
28	TMP12	Uncalibrated temperature, valid if TEMP is ENABLED and P2 in E-FIELD.
29	SWVERSION	Software version (15 in main mission).

Table 6. LAP HK parameters.

3.5 Instrument Calibration Data Products

Ground calibration data as well as in-flight calibrations are used and included in the archive. The following calibration products are included in the CALIB directory of the LAP archives:

<i>In flight</i>	<i>Product ID</i>
-------------------------	--------------------------

Measured current offset as a function of set bias voltage.	RPCLAPYYMMDD_CALIB_MEAS
Manually selected exceptions to the default rule for selecting RPCLAPYYMMDD_CALIB_MEAS.	RPCLAP_CALIB_MEAS_EXCEPT

<i>On ground (pre-flight)</i>	<i>Product ID</i>
Current biases and measured laboratory values.	RPCLAPYYMMDD_CALIB_IBIAS
Voltage biases and measured laboratory values.	RPCLAPYYMMDD_CALIB_VBIAS
Fine bias voltage settings and measured laboratory values.	RPCLAPYYMMDD_CALIB_FINE
Transfer function probe 1, Density mode	RPCLAPYYMMDD_CALIB_FRQ_D_P1
Transfer function probe 2, Density mode	RPCLAPYYMMDD_CALIB_FRQ_D_P2
Transfer function probe 1, E-field mode	RPCLAPYYMMDD_CALIB_FRQ_E_P1
Transfer function probe 2, E-field mode	RPCLAPYYMMDD_CALIB_FRQ_E_P2

As mentioned in Section 2.5, the transfer functions are currently not used in the production of calibrated or edited data sets, but are provided for reference. All other products are used in producing the calibrated data sets. *YYMMDD* is the date on which the corresponding calibration was made.

3.6 Software

There is no software included with the archive.

3.7 Documentation

Relevant documentation is archived in the DOCUMENT directory of each data set (see detailed description in Section 4.4.3.5).

3.8 Derived and other Data Products

There is as yet no DERIVED level data included in the archive.

3.9 Ancillary Data Usage

We use time correlation packets to convert into UTC as described in RO-ESC-IF-5003 issue B6 page 106, sect 18.1.2.1.

Geometry files are prepared using SPICE, whose kernels are based on information provided by ESOC.

-

4 Archive Format and Content

This section should be of interest as a reference to any user directly accessing the LAP archive.

4.1 Format and Conventions

4.1.1 Deliveries and Archive Volume Format

We use conventions defined as in the RO-EST-PL-5011_2_Rosetta_Archive_GVT_Plan, and conventions defined by the RPC team. For instance, our data directory naming conventions as in section 4.1.3 are RPC consistent. One Data Set corresponds to one Volume.

4.1.2 Data Set ID Formation

Example:

RO-C-RPCLAP-3-ESC2-Description-V1.0

RO	= INSTRUMENT_HOST_ID
C	= TARGET_ID
RPCLAP	= INSTRUMENT_ID
3	= Data processing level (DPL) number
CVP	= Mission phase abbreviation

Description can be EDITED, CALIB, CALIB2, or DERIVED thus essentially displaying in words the same information as the processing level.

One data set will be produced for each processing level:

Edited data = 2, Calibrated data = 3.

Within each data set TARGET_NAME and TARGET_TYPE is used to identify the current target.

4.1.3 Data Directory Naming Convention

Data files are stored in one directory per day, organized as shown in Figure 3.

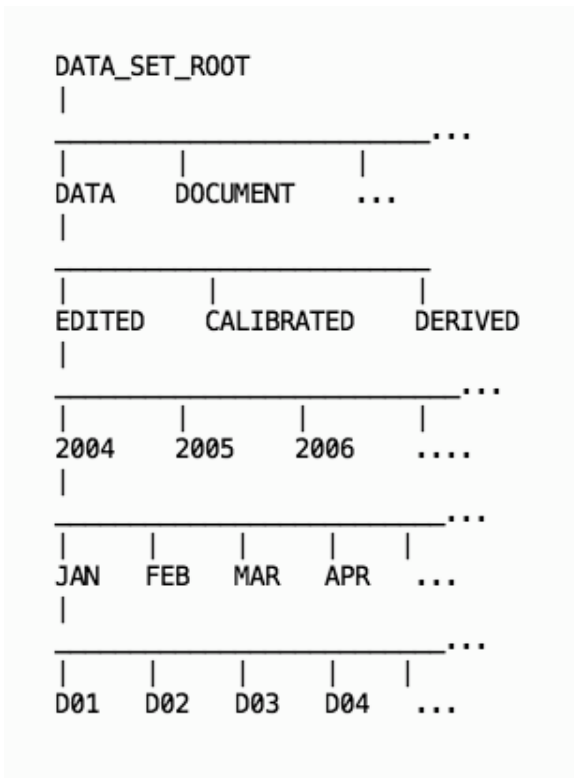

Figure 3. Data directory structure.

4.1.4 File Naming and Product ID Convention

This is the LAP file naming convention for files in the DATA directory. Product IDs follow the same convention as the file names, except that they omit the file extension.

For science data files, the file name contains detailed information on the type of data which makes it possible to partly avoid having to parse the corresponding PDS label file to understand the type of data.

(Edited) science data:	<i>RPCLAPYYMMDD_AAAa_bcdefghxx.ext</i>
(Calibrated) science data or sweep descriptions	<i>LAP_YYMMDD_hhmmss_iii_jek.ext</i>
(Calibrated) block list:	<i>LAP_YYMMDD_000000_BLKLIST.ext</i>
(Edited) Housekeeping:	<i>RPCLAPYYMMDD_AAA_H.ext</i>
Geometry:	<i>RPCLAPYYMMDD_L_GEOM.ext</i>

The meaning of codes (*italicized*) in the above product IDs can be found in Table 7.

Code	Meaning	Values
<i>YYMMDD</i>	Date	
<i>hhmmss</i>	Time of day	
<i>AAA</i>	Alphanumeric counter resetting to zero at the beginning of every day.	Three-digit alphanumeric counter running through the numbers 0 to 9 and then the letters A to Z, i.e. from 000 to ZZZ.
<i>a</i>	Indicates which ADC the data comes from	S = 16-bit ADC T = 20-bit ADC
<i>b</i>	Archiving level	R = Edited Raw C = Calibrated
<i>c</i>	Instrument mode	E = E-Field (voltage measurements and current bias) D = Density (current measurements and voltage bias)
<i>d</i>	Bias mode	B = Fix-bias S = Sweeping
<i>e</i>	Sensor (probe)	1 = Probe 1 2 = Probe 2 3 = Derived from both probe 1 and 2.
<i>f</i>	Analog filters applied to the data sampled by the 16-bit ADCs. Note that this number (4 or 8) will be present also in the file name of data sampled with the 20-bit ADCs, which always use the analog filter cutting at 20 Hz. For more information on filters, see Section 2.2.	8 = 8 kHz 4 = 4 kHz
<i>g</i>	Telemetry rate	M = Minimum N = Normal B = Burst
<i>h</i>	For science data this character is always an "S".	S
<i>iii</i>	Macro number.	Three hexadecimal digits.
<i>j</i>	Type of data.	I = Measured current V = Measured voltage B = Sweep description
<i>k</i>	Type of measurement.	L = Low frequency (fix bias; ADC20) H = High frequency (fix bias; ADC16) S = Sweep
<i>x</i>	For contingency. Not present if not	

	needed.	
L	Archiving level	2 = EDITED 3 = CALIBRATED
H	Non-changing identifier “H” to indicate housekeeping files. EDITED only	H
.ext	File extension	.LBL = PDS label file .TAB = Text file with data

Table 7. The meaning of codes in the descriptions of product IDs.

4.2 Standards Used in Data Product Generation

4.2.1 PDS Standards

LAP complies with PDS version 3, and we use version 3.6 of the PDS standard reference.

4.2.2 Time Standards

Time references in the LAP PDS archive are UTC and spacecraft clock. UTC time is displayed in the PDS CCYY-MM-DDThh:mm:ss.sss format. Conversion from spacecraft clock to UTC is done by our own software using RSOC-issued time calibration packets, except geometry files which use SPICE and kernels based on information provided by ESOC for the same conversion.

4.2.3 Reference Systems

The geometry files provide spacecraft positions in the target-centered solar orbital coordinate system. For Rosetta at comet 67P, we use the Cheops system. The spacecraft pointing is described using angles which are defined using the Sun, the target, and the s/c coordinate axes, which are briefly described in Figure 1.

4.3 Data Validation

All data is checked with DVAL.

4.3.1 EDITED

Data are automatically scanned for internal consistency when processed into edited format.

4.3.2 *CALIBRATED*

Data are visually scanned for noting obvious problems. Comparative investigations may be undertaken. Particularly noteworthy features are documented in the DATASET.CAT file in the CATALOG directory of each archive.

4.3.3 *DERIVED*

There are currently no derived-level data in the LAP archive.

4.4 Content

4.4.1 Volume Set

According to Section 19.4 in AD1.

4.4.2 Data Set

Our naming convention for the data set follows principles similar to those for the DATA_SET_ID, Section 4.1.2.

```
DATA_SET_NAME="ROSETTA-ORBITER <TARGET> RPCLAP  
<LEVELNUM> <MPHASE> <LEVELWORD> V<X>"
```

The variable fields here are:

<TARGET>	= Target name, i.e. LUTETIA.
<LEVELNUM>	= Data processing level numbers (e.g. 2 for EDITED).
<MPHASE>	= Mission phase abbreviation, example AST1.
<LEVELWORD>	= Data processing level in text (e.g. CALIB for calibrated or EDITED for edited data).
<X>	= Archive version number, e.g. 2.0.

One data set will be used for each processing level and mission phase. The data set name fits in the full length thus 60 characters.

4.4.3 Directories

4.4.3.1 Root Directory

Contents:

```
AAREADME.TXT  
CALIB  
CATALOG  
DATA  
DOCUMENT  
INDEX  
VOLDESC.CAT
```

See section 5.1 for more detail.

4.4.3.2 Calibration Directory

The directory CALIB contains calibration files, described in Section 3.5. This includes in-flight calibration files, so this directory grows with time.

Example listing of CALIB directory:

File name	Comment
CALINFO.TXT	Information on directory contents
RPCLAP030101_CALIB_FINE.LBL	Ground calibration of fine sweep voltage bias.
RPCLAP030101_CALIB_FINE.TAB	
RPCLAP030101_CALIB_FRQ_D_P1.LBL	Ground calibration, frequency response (transfer function) for P1 in voltage bias mode.
RPCLAP030101_CALIB_FRQ_D_P1.TXT	
RPCLAP030101_CALIB_FRQ_D_P2.LBL	Ground calibration, frequency response (transfer function) for P2 in voltage bias mode.
RPCLAP030101_CALIB_FRQ_D_P2.TXT	
RPCLAP030101_CALIB_FRQ_E_P1.LBL	Ground calibration, frequency response (transfer function) for P1 in current bias mode.
RPCLAP030101_CALIB_FRQ_E_P1.TXT	
RPCLAP030101_CALIB_FRQ_E_P2.LBL	Ground calibration, frequency response (transfer function) for P2 in current bias mode.
RPCLAP030101_CALIB_FRQ_E_P2.TXT	
RPCLAP030101_CALIB_IBIAS.LBL	Ground calibration of current bias.
RPCLAP030101_CALIB_IBIAS.TAB	
RPCLAP030101_CALIB_MEAS.LBL	Ground calibration of voltage bias mode data, identical in format to subsequent in-flight calibrations.
RPCLAP030101_CALIB_MEAS.TAB	
RPCLAP030101_CALIB_VBIAS.LBL	Ground calibration of voltage bias.
RPCLAP030101_CALIB_VBIAS.TAB	
RPCLAPyyymmdd_CALIB_MEAS.LBL	In-flight calibration of voltage bias

RPCLAPyymmdd_CALIB_MEAS.TAB	mode data. The TAB file contains measured offsets for P1 and P2 (voltage bias mode). Static calibration factors derived from ground calibrations are placed in the LBL as special keywords. A given data set will contain one or several of these. Note that a data set may contain in-flight calibrations made outside of the time interval officially covered by the data set.
RPCLAP_CALIB_MEAS_EXCEPT.LBL	Manually selected exceptions to the default rule for selecting RPCLAPyymmdd_CALIB_MEAS.
RPCLAP_CALIB_MEAS_EXCEPT.TAB	

4.4.3.3 Catalog Directory

Contents:

File name	Description
CATINFO.TXT	This file contains a list of all catalog files located in the CATALOG directory, with brief descriptions (as this table).
DATASET.CAT	Description of the data in the present Data Set, including caveats.
ROSETTA_INSTHOST.CAT	ROSETTA spacecraft information. File provided by ESA.
ROSETTA_MSN.CAT	ROSETTA Mission information. File provided by ESA.
RPCLAP_INST.CAT	LAP instrument description.
RPCLAP_PERS.CAT	LAP key people with contact details.
RPCLAP_REF.CAT	Catalog of relevant publications. File provided by ESA.
RPCLAP_SOFTWARE.CAT	Software catalog file (only containing the information that there is no s/w).

4.4.3.4 Index Directory

Contents:

INDXINFO.TXT
 INDEX.LBL
 INDEX.TAB

This directory contains the index files generated by the ESA S/W PVV.

4.4.3.5 Document Directory

This directory contains relevant LAP documentation as described below.

The FLIGHT REPORTS subdirectory contains LAP operations reports from the relevant mission phase (and may contain reports for other mission phases as well). These reports summarize the commanding, data taking, anomalies and outcomes of each operation. Note that one mission phase may include several operations, documented in separate reports (for example, EAR2 includes not only the operations around the 2nd Earth swing-by, but also a payload checkout activity).

LAP PDS Document Directory Contents	
Document	Description
DOCINFO.TXT	Describes directory contents
ERIKSSON2007A.LBL ERIKSSON2007A.PDF	Instrument description, label file and document as PDF: A. I. Eriksson, R. Boström, R. Gill, L. Åhlén, S.-E. Jansson, J.-E. Wahlund, M. André, A. Mälkki, J. A. Holtet, B. Lybekk, A. Pedersen, L. G. Blomberg and the LAP team, RPC-LAP: The Rosetta Langmuir probe instrument, <i>Space Sci. Rev.</i> , 128, 729-744, 2007, doi:10.1007/s11214-006-9003-3

RO-IRFU-LAP-EAICD-ver.LBL	EAICD (this document) as PDF, with label

RO-IRFU-LAP-EAICD- <i>ver</i> .PDF	file (<i>ver</i> = version number)
RO-IRFU-LAPMAC- <i>yymmdd</i> .LBL RO-IRFU-LAPMAC- <i>yymmdd</i> .PDF	Description of the LAP macros referred to by INSTRUMENT_MODE_ID, in PDF format, with label file. This replaces the outdated LAPMPF document present in previous releases. The date <i>yymmdd</i> is a version identifier.

4.4.3.6 Data Directory

See Section 4.1.3 for overall structure, Sections 4.1.4 and 3.1 for data products in the data directory and Section 5.3.2 for detailed examples of data product design.

5 Detailed Interface Specifications

5.1 Structure and Organization Overview

The contents of the directories in an EDITED or CALIBRATED Data Set are discussed in Section 4. The general organization of the archive can be seen from the following example for the data set of CALIBRATED data from the Lutetia flyby:

```
DATASET_ROOT
|-CALIB
|-CATALOG
|-DATA
|---CALIBRATED
|----2010
|-----JUL
|-----D07
|-----D08
|-----D09
|-----D10
|-----D11
|-----D12
|-----D13
|-DOCUMENT
|---FLIGHT_REPORTS
|-INDEX
```

For the contents of these directories, please see Section 4.4.

5.2 Data Sets, Definition and Content

Please see Section 2.4.

5.3 Data Product Design

5.3.1 *General Issues*

5.3.1.1 File Characteristics Data Elements

Data are stored in ASCII files with the extension “.TAB”. The associated label file, describing the data file in detail, has the same name but with the extension “.LBL” instead.

5.3.1.2 Data Object Pointers Identification Data Elements

The only pointer which is used is the pointer from the *.LBL file to the *.TAB file.

5.3.1.3 Instrument and Detector Descriptive Data Elements

Please see Sections 2.2 and 2.3.

5.3.1.4 Data Object Definition

All data are stored in *.TAB files. Their structure is defined in the OBJECT Table definition within the *.LBL files. Each data definition block has a DESCRIPTION which explains the meaning of the assigned data column exactly.

5.3.1.5 Mission-Specific Keywords

We use some specific keywords for the LAP instrument in the label files, as illustrated by the following examples:

```
ROSETTA:LAP_TM_RATE = "BURST"  
ROSETTA:LAP_P1_SWEEP_START_BIAS = "0x00c0"  
ROSETTA:LAP_CURRENT_CAL_16B_G0_05 = "6.10360876E-9"
```

The instrument-specific keywords used are tabulated in Table 8 below. Most of them regard instrument internal settings and are mostly present for completeness: see the instrument descriptions in the DOCUMENTS archive for understanding of their meaning. Note that Hex word means values from 0x0000 to 0xffff, though they are stored as character strings. **Note that all values in Table 8 are DATA_TYPE = CHARACTER and are enclosed in quotes in the label file.** The valid string values are separated by a colon (":") in Table 8, thus the colon is not part of the values themselves. Also note that the maximum character string length does not include counting quotes, null terminators, line feeds or carriage returns.

<i>Rosetta LAP-specific label keywords</i>	<i>Valid values separated by colon</i>	<i>Maximum character string length</i>	<i>Description</i>
LAP_BOOTSTRAP	ON:OFF	3	Bootstrapping on or off

LAP_CURRENT_CAL_1 6B_G0_05	<i>Ascii real string</i>	14	Convert TM to [A] ADC16's gain 0.05
LAP_CURRENT_CAL_1 6B_G1	<i>Ascii real string</i>	14	Convert TM to [A] ADC16's gain 1
LAP_CURRENT_CAL_2 0B_G0_05	<i>Ascii real string</i>	14	Convert TM to [A] ADC20's gain 0.05
LAP_CURRENT_CAL_2 0B_G1	<i>Ascii real string</i>	14	Convert TM to [A] ADC20's gain 1
LAP_FEEDBACK_P1, LAP_FEEDBACK_P2	DENSITY:E- FIELD	7	E-Field or Density feedback relay probe 1 or 2
LAP_IBIAS1, LAP_IBIAS2	<i>Hex word string</i>	6	Fix current bias sensor 1 or 2
LAP_P1_ADC16, LAP_P2_ADC16	DENSITY:E- FIELD	7	ADC16 probe 1 or 2 E- Field or Density mode
LAP_P1_ADC16_DIG_F ILT_CUTOFF, LAP_P2_ADC16_DIG_F ILT_CUTOFF	4688 Hz:2344 Hz:1172 Hz:586 Hz	7	Digital filter used on probe 1 or 2
LAP_P1_ADC16_DIG_F ILT_STATUS, LAP_P2_ADC16_DIG_F ILT_STATUS	DISABLED:ENAB LED	8	Digital filter on or off on probe 1 or 2
LAP_P1_ADC16_DOW NSAMPLE, LAP_P2_ADC16_DOW NSAMPLE	<i>Hex word string</i>	6	Data sensor 1 or 2 downsampled <i>n</i> times
LAP_P1_ADC16_FILTE R, LAP_P2_ADC16_FILTE R	4 KHz:8 KHz	5	Analog filter used
LAP_P1_ADC20, LAP_P2_ADC20	DENSITY:E- FIELD	7	ADC20 probe 1 or 2, E-Field or Density mode
LAP_P1_BIAS_MODE, LAP_P2_BIAS_MODE	E-FIELD:DENSIT Y	7	Probe 1 or 2 bias mode
LAP_P1_DENSITY_FIX DURATION, LAP_P2_DENSITY_FIX DURATION	<i>Hex word string</i>	6	Duration in samples of fix density bias data sensor 1 or 2
LAP_P1_EFIELD_FIX_D URATION, LAP_P2_EFIELD_FIX_D URATION	<i>Hex word string</i>	6	Duration in samples of fix E-field bias data sensor 1 or 2
LAP_P1_FINE_SWEEP OFFSET, LAP_P2_FINE_SWEEP OFFSET	<i>Hex word string</i>	6	Probe 1 or 2 fine sweep bias offset
LAP_P1_INITIAL_SWEE	<i>Hex word string</i>	6	Initial samples before a

P_SMPLS, LAP_P2_INITIAL_SWEE P_SMPLS			sweep starts on probe 1 and 2 respectively
LAP_P1_RANGE_DENS BIAS, LAP_P2_RANGE_DENS BIAS	+5:+32	3	Density bias range probe 1 or 2
LAP_P1_RX_OR_TX, LAP_P2_RX_OR_TX	ANALOG INPUT:TRANSMI TTER	12	Connected to transmitter or not
LAP_P1_STRATEGY_O R_RANGE, LAP_P2_STRATEGY_O R_RANGE	BIAS:FLOAT:GAI N 0.05:GAIN 1	9	E-Field strategy or density gain probe 1 or 2
LAP_P1_SWEEP_FOR MAT, LAP_P2_SWEEP_FOR MAT	UP:DOWN:DOW N UP:UP DOWN	7	Sweeping direction on probe 1 and 2 respectively
LAP_P1_SWEEP_PLAT EAU_DURATION, LAP_P2_SWEEP_PLAT EAU_DURATION	<i>Hex word string</i>	6	Samples on a plateau on probe 1 and 2 respectively
LAP_P1_SWEEP_RES OLUTION, LAP_P2_SWEEP_RES OLUTION	COARSE:FINE	6	Sweeping resolution on probe 1 and 2 respectively
LAP_P1_SWEEP_STAR T_BIAS, LAP_P2_SWEEP_STAR T_BIAS	<i>Hex word string</i>	6	Sweep start bias on probe 1 and 2 respectively
LAP_P1_SWEEP_STEP HEIGHT, LAP_P2_SWEEP_STEP HEIGHT	<i>Hex word string</i>	6	Height of a bias step on probe 1 and 2 respectively
LAP_P1_SWEEP_STEP S, LAP_P2_SWEEP_STEP S	<i>Hex word string</i>	6	Number of bias steps in sweep on probe 1 and 2 respectively
LAP_P1P2_ADC20_DO WNSAMPLE	<i>Hex word string</i>	6	Downsampling n times on ADC20 data sensor 1 and 2
LAP_P1P2_ADC20_MA LENGTH	<i>Hex word string</i>	6	Length of moving average used
LAP_P1P2_ADC20_STA TUS	EMPTY:P2T:P1T: P1T & P2T:P2F:P1T P2F:P1F:P1F P2T:P1F & P2F	9	Status: P1 = Sensor 1 P2 = Sensor 2 T = Truncated to 16 bit F = Full 20 bit

LAP_SWEEPING_P1, LAP_SWEEPING_P2	NO:YES	3	A sweep or time series
LAP_TM_RATE	NONE:MINIMUM: NORMAL:BURST	7	Telemetry rate
LAP_TRANSMITTER_A AMPLITUDE	LTRO1:MTRO2:H TRO3:LTR1:MTR 2:HTR3	5	Amplitude of transmitter signal full description. Not used up to now.
LAP_TRANSMITTER_F FREQUENCY	<i>Hex word string</i>	6	Frequency of transmitter square wave in Hz. Not used up to now.
LAP_TRANSMITTER_S STATUS	DISABLED:ENAB LED	8	Transmitter on or off
LAP_VBIAS1, LAP_VBIAS2	<i>Hex word string</i>	6	Fix voltage bias sensor 1 or 2
LAP_VOLTAGE_CAL_1 6B	<i>Ascii real string</i>	14	Convert TM to [V] ADC16s
LAP_VOLTAGE_CAL_2 0B	<i>Ascii real string</i>	14	Convert TM to [V] ADC20s
Table 8. LAP instrument-specific keywords. The table is sorted in alphabetical order of the first keyword in every cell of the left-most column.			

We have also defined a set of instrument modes using the already existing keyword INSTRUMENT_MODE_ID and INSTRUMENT_MODE_DESC. Instrument modes are identified by the onboard macro producing the data (Section 2.3). The macro ID (MCID) is a hexadecimal number 0x0100 to 0x0A07 where the last digit cannot be higher than 7. The middle digit represents the version number of the macro, starting from 0.

5.3.2 Data Product Design

LAP data products are described in Section 3. The file naming convention, identifying the data product, is given in Section 4.1.4

All science data products in the EDITED data sets have the same structure: ASCII tables giving time (in UT), spacecraft time, probe current value (bias or measured), and probe voltage (measured or bias) for one of the probes. The one exception to this is the differential measurements sometimes taken between the probes: in these files, the bias of both probes are given, adding an extra column.

We here provide the detailed design of the science data products by displaying example label files for each of them. The fix bias products for the EDITED and CALIBRATED data sets are very similar: only the units and the lengths of the time series differ.

5.3.2.1 Edited Data Product Design
